

EASY-ARCH

Single Arch Installation

1. The pre-formed Easy-Arch is centered in place. Nail or screw in with drywall screw at the top. If nail or screw does not penetrate arch easily, drill pilot hole in metal arch. Nail or screw in both ends of the legs.

2. Drywall is hung over the opening with self-tapping screws.

3. Cut out the opening using Easy-Arch as a guide. Use router or saw to shave off drywall from the opening.

4. Screw on drywall strips to the inner side of the wall.

In the time it takes a trained construction employee to make one conventional arch, the Easy-Arch can be installed over 25 times, perfectly every time.
